## Coating Technologies

### 家电用钢涂装技术

- 除彩涂板外，所有的家电外覆盖件在制成成品前均需要作涂装处理，以提高家电产品中钢铁件的使用寿命和装饰性。
- In addition to color-coated steel sheet, all body panels of home appliances need to be dealt with coating, to improve the life of home appliances and decoration.

# Coating Technology

## 涂装技术

### ● 提高家电产品中钢铁件的使用寿命

所有的钢铁件在空气中均会通过与其腐蚀介质 ( 空气中的  $O_2$ 、 $H_2O$ 、 $Cl$  等 ) 的接触渗透而发生锈蚀、腐烂,直至失去原有的机械强度。为延缓锈蚀的发生,最常用的手段是在钢铁件表面涂上一层有机涂层,使钢铁件与腐蚀介质隔绝,起到物理保护的作用。

### ○ Prolonging the service life of the steel pieces used in the household appliance products

All the iron and steel pieces will never escape the possibility of corrosion, decaying, even loss of original mechanical strength on the account of contact with and penetration of corrosive media in the air ( $O_2$ ,  $H_2O$ ,  $Cl$  etc. contained in the air). To inhibit the corrosion from occurring as long as possible, the approach that is frequently resorted to is applying organic coating on the surface to serve as a physical protection, by isolating it from the corrosive media.

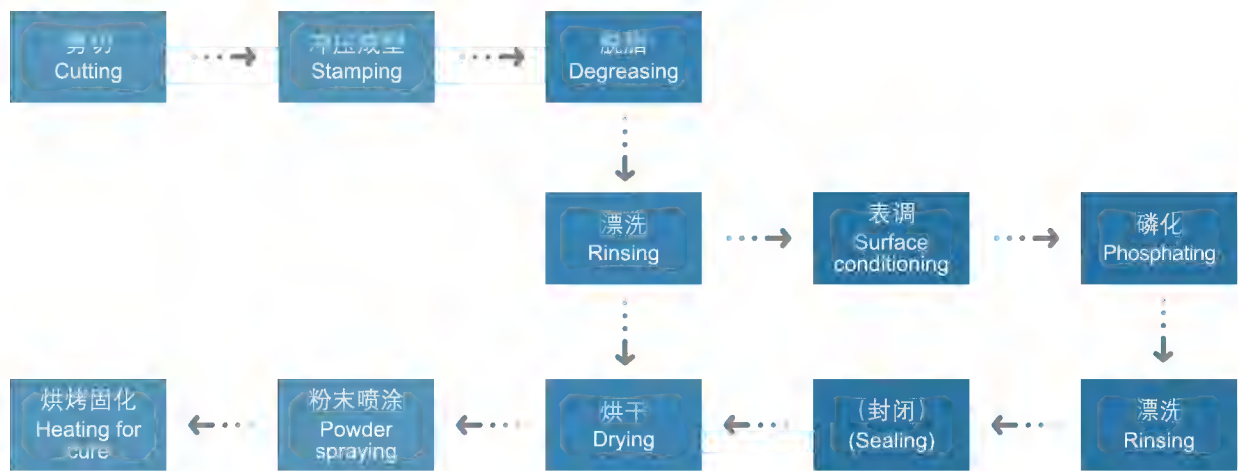

### ● 装饰性

通过有机涂层的涂装,可彻底改变钢板冷冰冰的单调外观。有机涂层能赋予钢板以各种颜色、质感,满足美学的要求。

### ○ Decoration function

Coating treatment with organic coating is such that the cold-as-steel and monotonous appearance of the steel sheet can be re-made thoroughly. The organic coating beautifies the steel sheet with different color and amplifies its sense of quality, meeting the aesthetical requirement.

● 典型涂装工艺流程  
Typical coating process flow

工艺段名称 Process	作用 Function	基本原理 Principle	工作方式 Mode
脱脂 Degreasing	产生洁净的金属表面 Make surface clean	碱性水剂脱脂 Water-borne detergent	喷淋、浸渍 Spray, dip
表调 Surface conditioning	金属表面改性，使之易于附着磷化膜 Modify the surface of substrate	化学法表面调整，形成磷化晶核 To form nuclei of phosphate crystal	喷淋、浸渍 Spray, dip
磷化 Phosphating	形成利于有机涂层附着和抗膜下腐蚀的化学转化膜 Form conversion coating with corrosion resistance and coating adhesion function	伪转化型单元或多元锌系磷化 Zinc or tri-cation phosphate crystal	喷淋、浸渍 Spray,dip
喷涂 Spray coating	形成装饰和高耐蚀表面 decorative and good corrosion-resistance surface	有机粉末涂料 Organic powder coating	静电喷涂 Electrostatic painting
固化 Curing	有机涂料固化成膜 Make the coating cross-linking	热交联固化 Cross linking	加热固化 Heat

## ● 常用脱脂工艺及基本原理

常用的脱脂工艺有两种：碱性水基脱脂和有机溶剂脱脂

### ● 碱性水剂脱脂

将碱性化学脱脂剂以喷、刷、浸、电解等方式与钢板表面的防锈油膜接触并发生物理及化学反应，将防锈油及钢板生产过程中吸附的残碳、铁粉等异物除去。

常用的碱性脱脂剂由  $\text{NaOH}$ 、 $\text{Na}_2\text{CO}_3$ 、 $\text{Na}_3\text{PO}_4$  等碱金属盐及复配的表面活性剂按比例溶解于水而成；当被处理材是镀锌板或耐指纹板时，考虑到镀锌层和有机膜的耐碱性，应适度降低脱脂剂的碱度。

工作时通过对油膜的渗透、浸润、乳化和分散作用，使油被乳化成牛奶状的混合物-乳液，并包裹着碳粉、铁粉等杂质，离开钢板进入脱脂液中，达到除油清洁的目的。

### ● 有机溶剂脱脂

将带油的金属工件置于三氯乙烷、三氯乙烯等的蒸汽中将油膜从金属表面除去。

通过有机溶剂对防锈油的溶解和稀释，将粘度大的油降低到十分低的粘度，使油与金属表面松弛，再通过包围它的溶剂而冲掉。

为强化溶解效果，常辅以超声波清洗。

当电镀锌 / 热镀锌耐指纹钢板表面轻微沾污时，可用蘸有乙醇或丙醇的干净软布擦拭，达到去污清洁的效果。

## ○ Regular degreasing process and its basic principle

There are two types of degreasing process in popular use-water-borne alkaline degreasing and organic solvent degreasing

### ○ Water-borne detergent degreasing

The detergent will react with the rust preventive oil on the steel sheet surface, physically and chemically, by way of spraying, brushing, dipping or in electrolytic manner etc. to remove the preventive oil and such impurities as residual carbon, iron powder and so on absorbed in the process of production.

The common detergent is made of  $\text{NaOH}$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{Na}_3\text{PO}_4$  and other alkali metal salts in a proportion to the compound surface active agent, then solved in water. Where the galvanized sheet or anti-fingerprint sheet is treated, consideration shall be taken into the alkali resistance of the galvanizing coating and of the organic film, and the alkalinity of detergent ought to be properly reduced.

The detergent reacts with oil film by means of penetration, soaking, emulsion and separation, to emulsify the oil into milk-like compound - emulsion, which carries with it the impurities such as powdery carbon, iron etc. departing off the sheet and is discharged into degreasing solution. Thus doing the end is served of oil removal and cleaning.

### ○ Organic solvent degreasing

It is to place the oil-contained metal pieces in the vapor composed of trichloro-ethane and trichlorethylene etc. to take the oil film off the metal surface.

As a result of dissolution and dilution to rust preventive oil by organic solvent, the oil viscosity ever high will be reduced to a very low degree whereby oil slackens off the metal surface, then is washed away with the solution carrying it.

Ultrasonic cleaning is frequently adopted to enhance the dissolution effect.

When the electro-galvanized / hot-dip galvanized anti-fingerprinting steel surface slightly soiled, it can take a dip ethanol or acetone soft cloth to wipe the plate, so as to achieve decontamination cleansing effect.

## ● 常用磷化工艺及基本原理

磷化处理是将被处理金属置于磷化液中，通过磷化液中磷酸二氢盐与金属的反应在表面生成一层致密的化学转化膜，作为喷涂有机涂层的化学前处理。处理方式通常为喷淋或浸渍。

家电磷化以伪转化型磷化为主，极少量采用转化型磷化（仅适用于冷轧板）。前者附着力与耐蚀性好，后者的加工性更好，处理时间更短，适合于快速流水线。

磷化能把金属表面的活性转化到最小的程度，把以后的腐蚀反应降到最低限度。

磷化膜能给金属提供一个“粗糙面”，给油漆或其他有机膜提供一个很好的咬合，增强其附着力。

磷化膜的等电位和绝缘性抑制了有机涂层的膜下腐蚀蔓延。

镀锌钢板涂装后由于锌层的牺牲阳极保护作用而有良好的防穿孔腐蚀性能，冷轧板由于磷化膜中含 Fe，能形成抗碱性优异的  $\text{Me}_2\text{Fe}(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$  晶体，从而在防止膜下腐蚀蔓延方面有优势。

## ● 常用喷涂工艺及基本原理

家电制造业中最常用的喷涂工艺是静电粉末涂装法。静电粉末涂装法是运用高压电场感应效应，使粉末涂料和被涂物件受感应而分别带上彼此相反的电荷，把粉末涂料吸附到被涂物件上去，然后把被涂物件放在烘烤炉烘烤流平成膜。热塑性粉末涂料只需要熔融流平即可，而热固性粉末涂料流平后还要交联固化成膜。

## ○ Regular phosphating process and its basic principle

Phosphating treatment is to place the metal to be treated into the phosphating solution where a layer of compact chemical conversion film is formed on the surface of metal reacting with dihydrogen phosphate in the phosphating solution, which serves as pre-chemical treatment of organic coating. The treatment is usually spraying or dipping. Phosphating of steel for appliance is adopting much more frequently the pseudo-conversion phosphating than the conversion phosphating (the latter applicable only to the cold rolled sheet). The former is featured as one with good adhesion and corrosion-resistance while the latter is of better workability and shorter handling time, suitable for fast streamline production.

Phosphating can inhibit the activity of metal surface to a minimum possible degree and minimize the subsequent corrosion action to a lowest possible level.

Phosphating film creates a “rough face” to the metal, providing a good bonding interface for paint or other organic coating and resultantly reinforcing the adhesion.

Equipotential and insulation with respect to phosphating film deter the corrosive creepage under the film of organic coating.

After coating the galvanized steel sheet has excellent resistance-to-punching corrosion by the reason of sacrificial protective action. The cold rolled sheet, due to the fact that Fe is contained in the phosphating film of it therefore capable of forming  $\text{Me}_2\text{Fe}(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$  crystal excellent in alkali-resistance, is outperforming in preventing the corrosive propagation under film.

## ○ Regular coating technology and its basic principle

The most popular coating technology in the household appliance manufacturing industry is electrostatic powder coating process. It is to apply induction, by means of induction effect of high-voltage electric field, on powder coating and the target part, so loaded with the opposite electric charge that the powder coating is absorbed onto the target part. The target parts will then be put in the baking oven for baking to flow flat into film. The powder coating is classified into two: thermoplastic type and thermosetting type. The former is made simply by its fusion to flow flat; the latter, after flow flat, still need cross-linking hardening to form film.

● 静电粉末喷涂有如下优点：

- 被涂物表面处理后可直接进行喷涂；
- 适用于 50-150μm 厚度的涂膜，涂膜厚度均匀，不容易流挂；
- 对被涂物的适应性强，可以喷不同大小和形状的被涂物，包括管道的内外壁；
- 对各种粉末涂料的适应性强，喷溢的粉末涂料可以回收利用，涂料的利用率高。

○ Electrostatic powder coating process has the following merits:

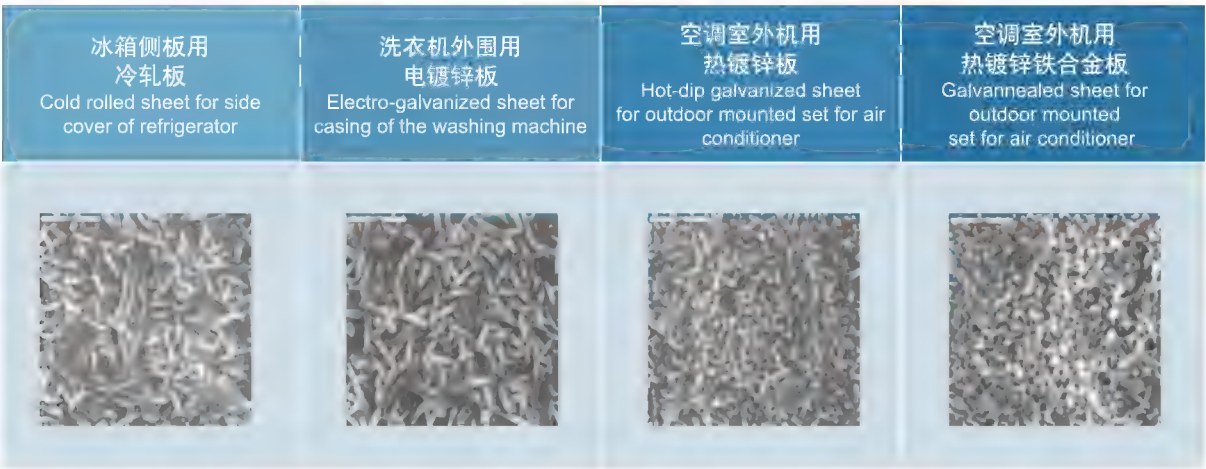

- It can be applied directly onto the target parts after its surface treatment;
- It is applicable where the coating thickness is between 50-50μm, and is of uniform thickness, no flowing mark.
- It is widely applicable to the different target parts, can be used on target part in different size and different shape, including inner and outer wall of the pipe.
- It is flexibly adaptable to various kinds of powder coating; the spilt powder coating can be reclaimed for use. Its utilization efficiency therefore is high.

● 典型家电行业用钢的涂装性实例

- 可磷化性
- 在一般伪转化型的多元锌系磷化体系和正常工艺条件下，冷轧板、镀锌板和热镀锌铁合金板都具有优良的可磷化性，磷化膜结晶细密，膜重一般可达 2-4g/m²。

○ Examples in illustration of coating performance for typical steel for appliance

- Phosphatability
- In a trication Zinc based phosphating system for general pseudo-conversion phosphating and under normal process conditions, the cold rolled sheet, galvanized sheet and galvanealed sheet are exclusively of excellent phosphatability, the phosphating film is compactly crystallined and weighed as to be ranging in 2-4g/m².

## 家电用环保系列产品介绍

- 一流的企业为社会提供的不仅仅是优质的产品和服务，更应该从环境、能源角度关爱自己赖以生存的地球。“环境友好型产品”的概念正是基于这种背景提出的，全球的不同地区和国家已纷纷出台了許多法律法规来倡导使用环境友好型产品，同时限制甚至禁止非环境友好产品的使用。其中与电器及电子设备产品密切相关的是欧盟 2002/95/EC 公布的 RoHS(Restriction of Hazardous Substances) 指令，禁用 / 限制对象为铅 Pb、镉 Cd、六价铬 Cr(VI)、汞 Hg 以及两种有机阻燃剂 PBDE 及 PBB，其中 Pb<1000ppm、Cd<100ppm、Cr<1000ppm，其他禁用。

- 作为碳钢基材自身并不含 RoHS 指令所限用的有害元素，但在根据终端需求对钢板进行了各类表面处理后，其金属镀层及非金属涂层中可能含一种或多种有害元素。例如带锌花的热镀锌锌层中含 Pb，传统的镀锌表面处理钢板（如钝化板、有机薄膜型耐指纹钢板或磷化封闭钢板）含 Cr<sup>6+</sup>，彩板预处理和涂料中含 Cr<sup>6+</sup>、Pb，电工钢绝缘涂层中含 Cr<sup>6+</sup>。Pb 和 Cr<sup>6+</sup> 属于环境污染因素的化学物质，在欧美已明确限制或禁止使用。

宝钢基于“绿色制造、制造绿色”的理念，通过改进传统的生产工艺，目前在生产过程中已做到主辅原料“无人为添加有害元素”，实现了钢板生产和最终产品的环保化，品种主要涉及家电用钢中的镀锌板、彩涂板及电工钢。

- Besides providing the society with value-added product and service, as a first-class enterprise, it should attach more importance to environmental protection and saving resources and energy for the earth we are living. The concept of "environment-friendly product" coming up based on this background, many countries and regions in the world have established laws and rules calling for using environment-friendly product, even prohibiting non-environment-friendly product. The RoHS (restriction of hazardous substances) directive 2002/95/EC of European union restricts using lead (Pb), hexavalent chromium (Cr VI), cadmium (Cd), mercury (Hg) and polybrominated biphenyls (PBB) or polybrominated diphenyl ethers (PBDE) in electrical and electronic equipment, among which Pb<1000ppm, Cd<100ppm, Cr<1000ppm, others are prohibited.

- There's no such hazardous element restricted by RoHS in carbon steel itself, but after surface treatment on carbon steel maybe there are one or more hazardous elements existing in metal coating or non-metal coating. For example, there's Pb existing in hot dip galvanized coating with spangle, Cr<sup>6+</sup> existing in steel sheet with traditional surface treatment (chromated steel, anti-fingerprint steel sheet or phosphate treatment including chromate sealed steel sheet), there are Cr<sup>6+</sup>, Pb existing in color coated steel sheet and coating, Cr<sup>6+</sup> existing in insulated coating of silicon steel. Cr<sup>6+</sup> and Pb are hazardous substances which pollute environment, have been restricted or prohibited in the accident.

Based on "green manufacture, manufacture greeny" concept, Baosteel has achieved "no man-made adding hazardous elements" in raw material during producing process through improving traditional producing technic, achieved environment-friendly on steel sheet producing and finished products, mainly concerns galvanized steel sheet, color coated steel sheet and silicon steel for home appliance.
